A neat book

By Anon Ymous

This book tells you how to get fast graphical and alphanumeric displays working with almost any existing microcomputer platform, for a small price, and without much hardware modifications.

From what I understand so far, Cheap Video utilizes your microcomputer's ability to jump to subroutines to activate a special "scan microinstruction" PROM, which then runs a bunch of 1-clock cycle instructions (Like LD Y,A0). This addresses another PROM, or RAM, that contains the graphical data you want to display on the screen. It's a great book to have for anyone interested in messing with old computer's hardware to do neat stuff.

Super!

This is an amazing book. You look inside a video terminal of that era and you will see HUNDREDS of IC's. Don Lancaster pulled some clever Wozniak-like tricks and got the chip count down to under ten cheap chips. ZThis was before the cheap availability of PALS and GALS and Altera programmable logic chips, so this was a pretty big deal. Plenty of cleverness and using parts in unexpected ways. Probably not a great guide as to how to do this today, but still a really interesting book and may give you some ideas of how to think outside the box.

A great history book on video terminal design

By calvinme

This book was the follow-on to Lancaster's book on the TV Terminal, which was the first book to describe an affordable way of building your own video terminal.

The Cheap Video Cookbook picked up where the author's TV Typewriter Cookbook ended. In 1978, this was a super low-cost way to get words, pictures, and op-code out of a computer and onto an ordinary TV set with minimum modifications to both. You will find complete do-it-yourself nuts and bolts construction details with thoroughly documented and debugged support software.

Inside are details on the seven IC circuit called the TVT 6 5/6. You could build this for as little as \$20 in 1978, and then software and module program it for virtually any alphanumeric format known at the time, including a scrolling 24 lines by 80 characters; or for virtually any graphics format of that day including a 256×256 mode and four-color graphics modes - hefty stuff for the 1970's. Those seven ICs gave cursor, loading, and editing capabilities, and did everything within the limited bandwidth ability of an ordinary TV set of that era. The system ran on most any 6500 or 6800 system, and could be adapted to other microcomputers.

It is absolutely laughable to think this was the state of the art in video display systems 30 years ago, but it is very well written and documented. Since you can get a used copy so cheaply it might be worth it for electronics history buffs. I still have my copy, which I actually used to build a video display controller back in the early 80's. It really is a pretty good source for showing absolute beginners the electronics nuts-and-bolts of what goes on in a video display system. Nobody builds individual systems any more, so consider it a well-written book on a lost art.
